*3rd Cardiac Cath Lab opened on April 21, 2006

The data provided reflects both the inpatient and outpatient referred for cardiac catheterization at the New Brunswick (NB) Heart Centre.

Column 1: Represents the 3-month timeframe during which the data in the following columns was collected.
Column 2: Represents the average number of patients who had a cardiac catheterization at the NB Heart Centre each month over a three-month period.

Columns 3 -11: Analysis of Patient Cases Completed
 - Displays wait time data for those patients who underwent a cardiac catheterization in the specified three-month period. Waiting times are measured from

the reception of the completed referral at the NB Heart Centre. A Recommended Maximum Wait Time (RMWT) is calculated based on the patient's clinical information. Using uniform scoring systems, patients are grouped according to the seriousness of their medical condition (urgent, semi-urgent, or elective).

Columns 3, 6 & 9: Median Wait (days) - Represents the wait time (in days) in which 50% of patients waited less than the time indicated, and 50% waited longer

than the time indicated for access to Interventional Cardiology services.

Columns 4, 7 & 10: 90th Percentile (days) - Represents the wait time (in days) in which 90% of patients waited less than the time indicated, and 10% of patients waited longer than the time indicated for access to Interventional Cardiology services.

Columns 5, 8 & 11: Represents the % of patients who accessed interventional cardiac services within the

RMWT.

Column 12: Represents the average number of patients waiting in the queue for a cardiac catheterization at the end of each month, over a 3-month period.

The New Brunswick Heart Centre Access Coordination personnel is responsible for the collection and reporting of the wait time data.
